

Corrections

Before watching this section please pay attention to these corrections:

Don't use 8ball as the name of the app

- Instead use ball8 or something that doesn't start with a number
- When creating the app I use the title "8ball".
- This works fine for iOS but will cause errors when trying to add the android platform.
- The reason for this is because of the widget-id in the config.xml.
- Ionic by default tries to create a unique widget-id composed of:-

```
com.ionicframework.<app-name><unique-id>
```

so e.g.

```
com.ionicframework.8ball1123asde2
```

- This app id unfortunately causes problems with android since on android the id can't start with a number.
